Miscellaneous

We overview the properties of Morrey spaces.

イロト イポト イヨト イヨト

3

Let $0 < q \le p \le \infty$. For an $L^q_{loc}(\mathbb{R}^n)$ -function *f*, its (classical) Morrey norm is defined by

$$\|f\|_{\mathcal{M}^{p}_{q}} \equiv \sup_{(x,r)\in\mathbb{R}^{n+1}_{+}} |B(x,r)|^{\frac{1}{p}-\frac{1}{q}} \left(\int_{B(x,r)} |f(y)|^{q} \mathrm{d}y \right)^{\frac{1}{q}}.$$
 (1)

The (classical) Morrey space $\mathcal{M}^p_q(\mathbb{R}^n)$ is the set of all $f \in L^q_{\text{loc}}(\mathbb{R}^n)$ for which the norm $||f||_{\mathcal{M}^p_q}$ is finite.

< ロ > < 同 > < 三 > .

Example

Let $0 < q \le p < \infty$. Let *B* be an open ball. Then

$$\|\chi_B\|_{\mathcal{M}^p_q} = \|\chi_B\|_{L^p}.$$

In fact, it is easy to see that

$$\|\chi_B\|_{\mathcal{M}^p_q} \le \|\chi_B\|_{L^p} \tag{3}$$

イロン 不得 とくほ とくほとう

(2)

ъ

from Hölder's inequality.

If we write out the norm $\|\chi_{\mathcal{B}}\|_{\mathcal{M}^p_a}$ in full, then

$$\|\chi_B\|_{\mathcal{M}^p_q} = \sup_{(x,r)\in\mathbb{R}^{n+1}_+} |B(x,r)|^{\frac{1}{p}-\frac{1}{q}} \left(\int_{B(x,r)} |\chi_B(y)|^q \mathrm{d}y \right)^{\frac{1}{q}}.$$

We can calculate and evaluate the integral precisely. The result is:

$$\|\chi_B\|_{\mathcal{M}^p_q} = \sup_{(x,r)\in\mathbb{R}^{n+1}_+} |B(x,r)|^{\frac{1}{p}-\frac{1}{q}} |B(x,r)\cap B|^{\frac{1}{q}} \ge |B|^{\frac{1}{p}} = \|\chi_B\|_{L^p}.$$
(4)

Combining (3) and (4), we obtain (2).

ヘロト ヘアト ヘヨト ヘ

.≣⇒

A major problem concerning simple/fundamental function spaces $BC(\mathbb{R}^n)$ and $L^p(\mathbb{R}^n)$ is that neither of them contains $|\cdot|^{-\alpha}$ for any $\alpha \in \mathbb{R}$. However, this simplest function appears everywhere but to handle this function, we need to restrict its domain. The Morrey space $\mathcal{M}_q^{\frac{n}{\alpha}}(\mathbb{R}^n)$ with $1 < q < \frac{n}{\alpha}$ contains $|\cdot|^{-\alpha}$. Here and below, B(r) abbreviates B(x, r) with x the origin.

The Morrey space
$$\mathcal{M}_q^{\frac{n}{\alpha}}(\mathbb{R}^n)$$
 with $1 < q < \frac{n}{\alpha}$ contains $f(x) = f_{\alpha}(x) \equiv |x|^{-\alpha}, x \in \mathbb{R}^n$. To check this, we observe that

$$\sup_{x \in \mathbb{R}^n} |B(x,r)|^{\frac{1}{p} - \frac{1}{q}} ||f||_{L^q(B(x,r))} = |B(r)|^{\frac{1}{p} - \frac{1}{q}} ||f||_{L^q(B(r))}.$$
 (5)

Example

Let
$$0 < q < p < \infty$$
, and let $\alpha, \beta \in \mathbb{R}$.
(1) Let $f(x) = f_{\alpha}(x) \equiv |x|^{\alpha}, x \in \mathbb{R}^{n}$. Then $f \in \mathcal{M}_{q}^{p}(\mathbb{R}^{n})$ if and
only if $\alpha = -\frac{n}{p}$.
(2) Let $g \equiv f\chi_{B(1)}$. Then $g \in \mathcal{M}_{q}^{p}(\mathbb{R}^{n})$ if and only if $\alpha \ge -\frac{n}{p}$.
Likewise let $h \equiv f\chi_{\mathbb{R}^{n} \setminus B(1)}$. Then $h \in \mathcal{M}_{q}^{p}(\mathbb{R}^{n})$ if and only if
 $\alpha \le -\frac{n}{p}$.
(3) Let $k \equiv f_{\alpha}\chi_{B(1)} + f_{\beta}\chi_{\mathbb{R}^{n} \setminus B(1)}$. From (2), we see that
 $k \in \mathcal{M}_{q}^{p}(\mathbb{R}^{n})$ if and only if $\alpha \ge -\frac{n}{p} \ge \beta$.

< □ →

Example (Toothbrush)

Let $0 < q < p < \infty$. We choose α so that $\left(\frac{\alpha}{N}\right)^{\frac{1}{p}} = \alpha^{\frac{1}{q}}$. We divide equally $[0, 1]^n$ into N^n cubes to have $Q_1^N, Q_2^N, \ldots, Q_{N^n}^N$. We will consider $f = f_N \equiv \sum_{j=1}^{N^n} \chi_{\alpha Q_j^N} \in L_c^{\infty}(\mathbb{R}^n)$. We show that $\|f\|_{\mathcal{M}_q^p} \sim \|f\|_{L^q}$.

To this end we use

$$\|f\|_{\mathcal{M}^{p}_{q}} \equiv \|f\|_{\mathcal{M}^{p}_{q}}^{\mathcal{Q}} = \sup_{(x,r)\in\mathbb{R}^{n+1}_{+}} |Q(x,r)|^{\frac{1}{p}-\frac{1}{q}} \left(\int_{Q(x,r)} |f(y)|^{q} \mathrm{d}y\right)^{\frac{1}{q}}$$

くロト (過) (目) (日)

Since f is supported on $[0, 1]^n$, we may assume that Q(x, r)runs over all cubes contained in $[0, 1]^n$. We first note that the supremum is attained by letting $r = 2\alpha$: If we choose $x \in \mathbb{R}^n$ suitably, then we have $|Q(x,r)|^{\frac{1}{p}-\frac{1}{q}} \|f\|_{L^{q}(Q(x,r))} \lesssim |Q(r)|^{\frac{1}{p}} = \|\chi_{\alpha}Q_{j}\|_{L^{p}} = \|f\|_{L^{q}}.$ If $2r < \alpha$ instead, then we have $|Q(x,r)|^{\frac{1}{p}-\frac{1}{q}} ||f||_{L^{q}(Q(x,r))} \leq |Q(x,r)|^{\frac{1}{p}} < ||f||_{L^{q}}$ no matter where x is. Thus, to show the result, we have only to consider the cubes Q(x,r) with $\alpha \leq 2r \leq 1$. If Q(x,r) intersects Q_i^N and Q_k^N with $1 \le i < k \le N^n$, then there exists $R \in Q$ such that $R \cap \text{supp}(f)$ is realized as the union $\{Q_i^N\}_{i \in J}$ for some $J \subset \{1, 2, \dots, N^n\}$, that R contains Q(x, r) and that $|R| \leq_{\alpha} |Q(x, r)|$. Hence, by translating *R* if necessary, we may assume $R = [0, kN^{-1}]^n$ for some $k = 1, 2, \ldots, N$. For this R, A B > A
 A
 B > A
 A $|O(x, r)|^{\frac{1}{n}-\frac{1}{n}}||f||$

Morrey spaces

Yoshihiro Sawano

Let $0 < \alpha < n$. Let I_{α} be the fractional integral operator given by

$$I_{\alpha}f(x) \equiv \int_{\mathbb{R}^n} \frac{f(y)}{|x-y|^{n-\alpha}} \mathrm{d}y \quad (x \in \mathbb{R}^n)$$
(6)

æ

for a non-negative measurable function f.

Theorem

Let $1 <math>1 < q \le q_0 < \infty$ and $1 < r \le r_0 < \infty$. Assume

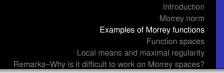

$$r < q, n/q_0 \le \alpha < n/p_0,$$

 $1/r_0 = 1/p_0 + 1/q_0 - \alpha/n, \quad r/r_0 = p/p_0$

Then

$$\|gl_{\alpha}f\|_{\mathcal{M}_{r}^{r_{0}}} \leq C\|f\|_{\mathcal{M}_{\rho}^{p_{0}}}\|g\|_{\mathcal{M}_{q}^{q_{0}}}.$$

▲□▶▲□▶▲□▶▲□▶ □ のQの

Here is another application.

$$L_0 := -\operatorname{div} A \nabla = \sum_{i,j=1}^n \frac{\partial}{\partial x_i} \left(a_{ij} \frac{\partial}{\partial x_j} \right)$$

We consider an elliptic differential operator *L* with non-smooth coefficients generated by a symmetric matrix $A = [a_{ij}]_{i,j=1}^n \in (L^{\infty}(\mathbb{R}^n))^{n^2}$ given by

$$L := I + L_0 = I - \sum_{i,j=1}^n \frac{\partial}{\partial x_i} \left(a_{ij} \frac{\partial}{\partial x_j} \right).$$

ヘロト 人間 ト ヘヨト ヘヨト

For an $L^q_{loc}(\mathbb{R}^n)$ -function *f*, its non-local Morrey norm is defined by

$$\|f\|_{M^p_q} \equiv \sup_{(x,r)\in\mathbb{R}^{n+1}_+,r\geq 1} |B(x,r)|^{\frac{1}{p}-\frac{1}{q}} \left(\int_{B(x,r)} |f(y)|^q \mathrm{d}y\right)^{\frac{1}{q}}.$$
 (7)

The non-local Morrey space $M_q^p(\mathbb{R}^n)$ is the set of all $f \in L^q_{loc}(\mathbb{R}^n)$ for which the norm $||f||_{\mathcal{M}_q^p}$ is finite.

イロト イポト イヨト イヨト

Lemma

Let
$$p \ge 2$$
. Then for all $u \in W^1 M_2^p(\mathbb{R}^n)$
$$\|u\|_{M_2^p} + \|Du\|_{(M_2^p)^n} \prec \|(1-\Delta)^{-1/2} Lu\|_{M_2^p}.$$

We will show the well-posedness for the Cauchy problem of a two dimensional semi-linear elliptic parabolic system

$$\begin{cases} \partial_t u(t,x) - \Delta u(t,x) + \operatorname{div}(u(t,x)\nabla\psi(t,x)) = 0, & (t,x) \in \mathbb{R}^3_+ \\ -\Delta\psi(t,x) = \kappa u(t,x), & (t,x) \in \mathbb{R}^3_+ \\ u(0,x) = u_0(x), & x \in \mathbb{R}^2 \end{cases}$$
(8)

with $\kappa = \pm 1$. When $\kappa = 1$, system (8) describes a model for the chemotaxis and the system is called the (simplified) Keller–Segel equation, the Jäger–Luckhaus system or the Nagai model. When $\kappa = -1$, system (8) is called as a mono-polar drift-diffusion system for the semi-conductor simulation. In this talk, we will handle both of them but we suppose $\kappa = 1$ to simplify.

We consider the integral version of the Keller-Segel equation.

$$u = e^{t\Delta}u_0 - \int_0^t e^{(t-s)\Delta} div[u(s)\nabla(-\Delta)^{-1}u(s)]ds$$
 (t > 0). (9)

We present a typical result.

イロト イポト イヨト イヨト

3

Theorem

Let $\kappa = \pm 1$. Let $1 \le q \le p < 2$. Define $\delta \equiv 2 - \frac{2}{p}$. Write I = [0, T). Then for $u_0 \in \dot{\mathcal{N}}_{pq2}^{-\delta}(\mathbb{R}^2)$, there exists T > 0 and a unique solution

$$u \in \mathcal{C}(I; \dot{\mathcal{N}}_{pq2}^{-\delta}(\mathbb{R}^2)) \cap L^2(I; \dot{\mathcal{N}}_{pq2}^{1-\delta}(\mathbb{R}^2)) \cap L^2(I; \dot{B}_{\infty 1}^{-1}(\mathbb{R}^2))$$

to (9). Besides u satisfies

$$u \in C(\mathrm{Int}(I); \dot{\mathcal{N}}^{2-\delta}_{\rho q 2}(\mathbb{R}^2)) \cap C^1(\mathrm{Int}(I); \dot{\mathcal{N}}^{-\delta}_{\rho q 2}(\mathbb{R}^2))$$

and the flow map $u_0 \in \dot{\mathcal{N}}_{pq2}^{-\delta}(\mathbb{R}^2) \mapsto u \in C(I; \dot{\mathcal{N}}_{pq2}^{-\delta}(\mathbb{R}^2))$ is Lipschitz continuous.

Introduction Morrey norm Examples of Morrey functions Function spaces

Besov-Morrey spaces

Local means and maximal regularity

Remarks-Why is it difficult to work on Morrey spaces?

Why do I want to use Morrey spaces?

- Generic Morrey spaces fail to be
 - separable,
 - reflexive.

② $L^{p}(\mathbb{R}^{n}) = \mathcal{M}_{p}^{p}(\mathbb{R}^{n}) \subset \mathcal{M}_{q}^{p}(\mathbb{R}^{n})$. This in turn implies that we are interested in the generic case of *p* ≠ *q*.

- Solution Morrey spaces do not have C[∞]_c(ℝⁿ) as a dense subspace. Nor do they have L^p(ℝⁿ) as a dense subspace.
- Morrey spaces sometimes nicely extend the Sobolev embedding.
- But sometimes Morrey spaces do not give us any nice extension of the Sobolev embedding. (Embeddings between Besov–Morrey spaces and Triebel–Lizorkin–Morrey spaces).

Denote by $\mathcal{P} = \mathcal{P}(\mathbb{R}^n)$ the set of all polynomials. Then using the standard mapping $f \mapsto F_f$ we can regard $\mathcal{P}(\mathbb{R}^n)$ as the subset of $\mathcal{S}'(\mathbb{R}^n)$. Denote by $\mathcal{P}_d(\mathbb{R}^n)$ the set of all polynomial functions with degree less than or equal to d, so that $\mathcal{P}(\mathbb{R}^n) \equiv \bigcup_{d=0}^{\infty} \mathcal{P}_d(\mathbb{R}^n)$. It is understood that $\mathcal{P}_{-1}(\mathbb{R}^n) = \{0\}$.

Remarks-Why is it difficult to work on Morrey spaces?

Littlewood–Paley patch

Besov-Morrey spaces

Let $\psi \in \mathcal{S}(\mathbb{R}^n)$ satisfy $\chi_{B(2)} \leq \psi \leq \chi_{B(4)}$. Write $\varphi = \psi - \psi(2 \cdot)$. For $f \in \mathcal{S}'(\mathbb{R}^n)$, we define

$$\varphi_j(D)f = \mathcal{F}^{-1}[\varphi(2^{-j}\cdot)\mathcal{F}f].$$

This definition makes sense for $f \in \mathcal{S}'(\mathbb{R}^n)/\mathcal{P}(\mathbb{R}^n)$.

イロト イポト イヨト イヨト

æ

For $f \in \mathcal{S}'(\mathbb{R}^n)/\mathcal{P}(\mathbb{R}^n)$, we define

$$\|f\|_{\dot{\mathcal{K}}^{s}_{pqr}} \equiv \left(\sum_{j=-\infty}^{\infty} (2^{js} \|\varphi_{j}(D)f\|_{\mathcal{M}^{p}_{q}})^{r}\right)^{\frac{1}{r}}, \quad (10)$$
$$\|f\|_{\dot{\mathcal{E}}^{s}_{pqr}} \equiv \left\|\left(\sum_{j=-\infty}^{\infty} 2^{jrs} |\varphi_{j}(D)f|^{r}\right)^{\frac{1}{r}}\right\|_{\mathcal{M}^{p}_{q}}. \quad (11)$$

The spaces $\dot{\mathcal{N}}_{pqr}^{s}(\mathbb{R}^{n})$, which we call the *homogeneous* Besov–Morrey space and the *homogeneous* Triebel–Lizorkin–Morrey space respectively, and $\dot{\mathcal{E}}_{pqr}^{s}(\mathbb{R}^{n})$ are the sets of all $f \in \mathcal{S}'(\mathbb{R}^{n})/\mathcal{P}(\mathbb{R}^{n})$ for which the norms $\|f\|_{\dot{\mathcal{N}}_{pqr}^{s}}$ and $\|f\|_{\dot{\mathcal{E}}_{pqr}^{s}}$ are finite, respectively.

Besov-Morrey spaces

We recall the definition of $\mathcal{S}_{\infty}(\mathbb{R}^n)$ and $\mathcal{S}'_{\infty}(\mathbb{R}^n)$.

Definition $(\mathcal{S}_{\infty}(\mathbb{R}^n) \text{ and } \mathcal{S}'_{\infty}(\mathbb{R}^n))$

Define the *Lizorkin function space* $S_{\infty}(\mathbb{R}^n)$ by $S_{\infty}(\mathbb{R}^n) \equiv S(\mathbb{R}^n) \cap \mathcal{P}(\mathbb{R}^n)^{\perp}$. Equip $S_{\infty}(\mathbb{R}^n)$ with the topology induced by $S(\mathbb{R}^n)$. The *Lizorkin distribution space* $S'_{\infty}(\mathbb{R}^n)$ is the topological dual space $S_{\infty}(\mathbb{R}^n)$. That is, define

 $\mathcal{S}'_{\infty}(\mathbb{R}^n) \ = \ \{F: \mathcal{S}_{\infty}(\mathbb{R}^n) \to \mathbb{C} \ : \ F \text{ is continuous and } \mathbb{C}\text{-linear}\}.$

イロト イポト イヨト イヨト

As for the space $\dot{\mathcal{N}}_{pqr}^{s}(\mathbb{R}^{n})$, we have a simpler representation.

Theorem

Let $1 \leq q \leq p < \infty$, $1 \leq r \leq \infty$ and $s \in \mathbb{R}$. Let $f \in \dot{\mathcal{N}}_{par}^{s}(\mathbb{R}^{n})$. Then there exists a sequence $\{P_j\}_{i=1}^{\infty}$ of polynomials of degree $d = \max\left(-1, \left\lceil s - \frac{n}{p} \right\rceil\right)$ such that $g = \lim_{j \to \infty} \left(P_j + \sum_{k=-j}^{\infty} \varphi_j(D) f \right)$ exists in $S'(\mathbb{R}^n)$. In particular, $f = \lim_{j \to \infty} \left(P + P_j + \sum_{k=-j}^{\infty} \varphi_j(D) f \right)$ holds in the topology of $\mathcal{S}'(\mathbb{R}^n)/\mathcal{P}_d(\mathbb{R}^n)$ for some $P \in \mathcal{P}(\mathbb{R}^n)$. Yoshihiro Sawano Morrey spaces

Theorem (Paraproduct)

Suppose that we have parameters $p_1, p_2, p, q_1, q_2, q, r, s_1, s_2$ satisfying

$$\begin{split} 1 &\leq q_{1} \leq p_{1} < \infty, \quad 1 \leq q_{2} \leq p_{2} < \infty, \\ 1 &\leq q \leq p < \infty, \quad 1 \leq r < \infty, \quad s_{1}, s_{2} > 0, \\ &\frac{1}{p} = \frac{1}{p_{1}} + \frac{1}{p_{2}}, \quad \frac{1}{q} = \frac{1}{q_{1}} + \frac{1}{q_{2}}. \end{split}$$
 $Then \|f \cdot g\|_{\dot{\mathcal{N}}^{s_{1}}_{pqr}} \lesssim \|f\|_{\dot{\mathcal{N}}^{s_{2}}_{p_{1}q_{1}\infty}} \|g\|_{\dot{\mathcal{N}}^{s_{1}}_{p_{2}q_{2}r}} + \|f\|_{\dot{\mathcal{N}}^{s_{1}}_{pqr}} \|g\|_{L^{\infty}} \text{ for all } f \in \dot{\mathcal{N}}^{s_{2}}_{p_{1}q_{1}\infty}(\mathbb{R}^{n}) \cap \dot{\mathcal{N}}^{s_{1}}_{pqr}(\mathbb{R}^{n}) \text{ and } g \in \dot{\mathcal{N}}^{s}_{p_{2}q_{2}r}(\mathbb{R}^{n}) \cap L^{\infty}(\mathbb{R}^{n}). \end{split}$

One important observation is that the Morrey norm $\|\cdot\|_{\mathcal{M}^p_q}$ and the Besov–Morrey norm $\|\cdot\|_{\dot{\mathcal{N}}^S_{pqu}}$ are not that different in front of $\partial_k e^{t\Delta}$:

Theorem (S. and Nogayama)

Let $1 \leq q \leq p < \infty$, $1 \leq r \leq \infty$ and $s, S \in \mathbb{R}$. Assume that $d \in \{0, -1\}$. Then for $f \in \dot{\mathcal{N}}^{s}_{pqr}(\mathbb{R}^{n}) \subset \mathcal{S}'(\mathbb{R}^{n})/\mathbb{C}$,

$$\|f\|_{\dot{\mathcal{N}}^{s}_{pqr}} \sim \sum_{k=1}^{n} \left(\int_{0}^{\infty} \sum_{j=-\infty}^{\infty} (t^{-\frac{1}{2}S+\frac{1}{2}s} \|\sqrt{t}\partial_{k}[e^{t\Delta}f]\|_{\dot{\mathcal{N}}^{s}_{pqu}})^{r} \frac{dt}{t} \right)^{\frac{1}{r}}.$$

It is important that we have freedom in the choice of *S* and *u*. Especially, the choice of *u* is important because the paraproduct estimates are somewhat weak in that we need to use $\|\cdot\|_{\mathcal{N}^{\frac{n}{p}}_{pq1}}$. It matters that we are forced to take 1 in the third index. The space $\mathcal{N}^{\frac{n}{p}}_{pq1}(\mathbb{R}^n)$ can be embedded into $L^{\infty}(\mathbb{R}^n)$ mainly by the use of the triangle inequality and the Plancherel–Polya–Nikolski'i inequality.

Maximal regularity-more general results

We extend the result by Ogawa and Shimizu in 2010 to Besov–Morrey spaces. We start with the heat equation.

$$\begin{cases} \partial_t u - \Delta u = f & \text{ in } \mathbb{R}^{n+1}_+, \\ u(0, \cdot) = u_0 & \text{ on } \mathbb{R}^n. \end{cases}$$
(12)

Theorem

Let $1 \le q \le p < \infty$, $1 \le \rho \le \infty$. Consider the heat equation (12) with $f \in L^{\rho}([0,\infty); \dot{\mathcal{N}}^{0}_{pq\rho}(\mathbb{R}^{n}))$ and $u_{0} \in \dot{\mathcal{N}}^{2-2/\rho}_{pq\rho}(\mathbb{R}^{n})$. Then

$$\begin{aligned} \|\partial_t u\|_{L^{\rho}([0,\infty);\dot{\mathcal{N}}^0_{pq\rho})} + \|\nabla^2 u\|_{L^{\rho}([0,\infty);\dot{\mathcal{N}}^0_{pq\rho})} \\ \lesssim \|u_0\|_{\dot{\mathcal{N}}^{2-2/\rho}_{pq\rho}} + \|f\|_{L^{\rho}([0,\infty);\dot{\mathcal{N}}^0_{pq\rho})}. \end{aligned}$$

From the viewpoint of harmonic analysis From the viewpoint of PDEs and the maximal regularity Maximal regularity–more general results

Theorem

Let $\kappa = \pm 1$. Let $1 \le q \le p < 2$. Define $\delta \equiv 2 - \frac{2}{p}$. Write I = [0, T). Then for $u_0 \in \dot{\mathcal{N}}_{pq2}^{-\delta}(\mathbb{R}^2)$, there exists T > 0 and a unique solution

$$u \in \mathcal{C}(I; \dot{\mathcal{N}}_{pq2}^{-\delta}(\mathbb{R}^2)) \cap L^2(I; \dot{\mathcal{N}}_{pq2}^{1-\delta}(\mathbb{R}^2)) \cap L^2(I; \dot{B}_{\infty 1}^{-1}(\mathbb{R}^2))$$

to (9). Besides u satisfies

$$u \in C(\mathrm{Int}(I); \dot{\mathcal{N}}^{2-\delta}_{\rho q 2}(\mathbb{R}^2)) \cap C^1(\mathrm{Int}(I); \dot{\mathcal{N}}^{-\delta}_{\rho q 2}(\mathbb{R}^2))$$

and the flow map $u_0 \in \dot{\mathcal{N}}_{pq2}^{-\delta}(\mathbb{R}^2) \mapsto u \in C(I; \dot{\mathcal{N}}_{pq2}^{-\delta}(\mathbb{R}^2))$ is Lipschitz continuous.

Introduction Morrey norm Examples of Morrey functions Function spaces

Local means and maximal regularity

Remarks-Why is it difficult to work on Morrey spaces?

Other estimates I

From the viewpoint of harmonic analysis From the viewpoint of PDEs and the maximal regularity Maximal regularity-more general results

(1) Let $1 < q < p < \infty$ and $1 < \rho < \infty$. Then $\left(\int_{0}^{\infty} (\|\nabla \exp(t\Delta)u_{0}\|_{\dot{\mathcal{N}}^{0}_{pq1}})^{\rho} \mathrm{d}t\right)^{\frac{1}{\rho}} \lesssim \|u_{0}\|_{\dot{\mathcal{N}}^{1-\frac{2}{\rho}}}$ for all $u_0 \in \dot{\mathcal{N}}_{pao}^{1-\frac{2}{\rho}}(\mathbb{R}^n)$. (2) Let $1 < q < p < \infty$ and $1 < \rho < \infty$. Then $\sup \|\nabla \exp(t\Delta) u_0\|_{\dot{\mathcal{N}}^0_{pq_0}} \lesssim \|u_0\|_{\dot{\mathcal{N}}^1_{pq_0}}$ t > 0for all $u_0 \in \dot{\mathcal{N}}_{pq_0}^1(\mathbb{R}^n)$. (3) For all $u_0 \in \dot{B}^0_{\infty,2}(\mathbb{R}^n)$, $\left(\int_0^\infty (\|\nabla \exp(t\Delta)u_0\|_{\dot{B}^0_{\infty,1}})^2 \mathrm{d}t\right)^{\frac{1}{2}} \lesssim \|u_0\|_{\dot{B}^0_{\infty,2}}.$

We recall the following embedding:

Theorem (S.)

Let
$$1 \le q , $1 \le r \le \infty$ and $s \in \mathbb{R}$. Then$$

$$\dot{\mathcal{N}}^{s}_{pq\min(q,r)}(\mathbb{R}^{n}) \hookrightarrow \dot{\mathcal{E}}^{s}_{pqr}(\mathbb{R}^{n}) \hookrightarrow \dot{\mathcal{N}}^{s}_{pq\infty}(\mathbb{R}^{n}).$$

This is a remarkable contrast to the well-known embedding:

$$\begin{split} \dot{B}^{s}_{\rho\min(\rho,r)}(\mathbb{R}^{n}) &= \dot{\mathcal{N}}^{s}_{\rho\rho\min(\rho,r)}(\mathbb{R}^{n}) \hookrightarrow \dot{B}^{s}_{\rho r}(\mathbb{R}^{n}) = \dot{\mathcal{E}}^{s}_{\rho\rho r}(\mathbb{R}^{n}) \\ &\hookrightarrow \dot{B}^{s}_{\rho\max(\rho,r)}(\mathbb{R}^{n}) = \dot{\mathcal{N}}^{s}_{\rho\rho\max(\rho,r)}(\mathbb{R}^{n}), \end{split}$$

Embeddings Compatibility of the heat semigroup and the initial data Miscellaneous

・ロト ・ 理 ト ・ ヨ ト ・

We also have a similar phenomenon.

Theorem (Haroske, Skrzypczak)

Let $1 \leq q , <math>1 \leq r \leq \infty$ and $s \in \mathbb{R}$. Also let $1 \leq q^{\dagger} < p^{\dagger} < \infty$ and $s^{\dagger} \in \mathbb{R}$. Assume

$$rac{p}{q}=rac{p^{\dagger}}{q^{\dagger}}, \quad s-rac{n}{p}=s^{\dagger}-rac{n}{p^{\dagger}}.$$

Then

$$\dot{\mathcal{E}}^{s}_{pqr}(\mathbb{R}^{n}) \hookrightarrow \dot{\mathcal{N}}^{s^{\dagger}}_{p^{\dagger}q^{\dagger}\infty}(\mathbb{R}^{n})$$

This is a good contrast to the embedding:

$$\dot{B}^{s}_{\rho\rho r}(\mathbb{R}^{n}) = \dot{\mathcal{E}}^{s}_{\rho q r}(\mathbb{R}^{n}) \hookrightarrow \dot{B}^{s}_{\rho^{\dagger}\rho^{\dagger}\rho}(\mathbb{R}^{n}) = \dot{\mathcal{N}}^{s^{\dagger}}_{\rho^{\dagger}\rho^{\dagger}\rho}(\mathbb{R}^{n}).$$

Theorem (Hakim, Nakamura, S.)

Let $1 \leq q \leq p < \infty$. Then $f \in \mathcal{M}^p_q(\mathbb{R}^n)$ satisfies $e^{t\Delta} f \to f$ in $\mathcal{M}^p_q(\mathbb{R}^n)$ if and only if f can be approximated in the Morrey norm $\|\cdot\|_{\mathcal{M}^p_q}$ by Morrey functions whose derivative up to order 1 belongs to $\mathcal{M}^p_q(\mathbb{R}^n)$.

Theorem (Nogayama, S.)

Let $1 \leq q , <math>1 \leq r \leq \infty$ and $s \in \mathbb{R}$. Then any $f \in \dot{\mathcal{N}}_{par}^{s}(\mathbb{R}^{n})$ satisfies $e^{t\Delta}f \to f$ in $\dot{\mathcal{N}}_{par}^{s}(\mathbb{R}^{n})$ as $t \downarrow 0$.

Theorem

Let $1 \leq q , <math>1 \leq r \leq \infty$ and $s > \frac{1}{p}$. Then $\operatorname{Tr}_{\mathbb{R}^n}$ maps $\dot{\mathcal{N}}_{pqr}^{s}(\mathbb{R}^n)$ surjectively to $\dot{\mathcal{N}}_{pqr}^{s-\frac{1}{p}}(\mathbb{R}^n)$, while $\operatorname{Tr}_{\mathbb{R}^n}$ maps $\dot{\mathcal{E}}_{pqr}^{s}(\mathbb{R}^n)$ surjectively to $\dot{\mathcal{E}}_{pqq}^{s-\frac{1}{p}}(\mathbb{R}^n)$. In particular, $\operatorname{Tr}_{\mathbb{R}^n}$ maps $W^s \mathcal{M}_q^p(\mathbb{R}^n)$ (the case of r = 2) surjectively to $\dot{\mathcal{E}}_{pqq}^{s-\frac{1}{p}}(\mathbb{R}^n)$.

Around a decade ago, Besov-type spaces and Triebel-Lizorkin-type spaces are defined by Yang and Yuan. It turned out that Besov-type spaces are different from Besov–Morrey spaces but that Triebel-Lizorkin-type spaces are the same as Triebel-Lizorkin–Morrey spaces.
